29 |         {
30 |             while (st == null || !st.hasMoreElements()) {
31 |                 try {
32 |                     st = new StringTokenizer(br.readLine());
33 |                 } catch (Exception e) {
34 |                     return false;
```

```
35 |                 }
36 |             }
37 |             return true;
38 |         }
39 |
40 |         String next()
41 |         {
42 |             if (hasNext())
43 |                 return st.nextToken();
44 |             return null;
45 |         }
46 |
47 |         int nextInt()
48 |         {
49 |             return Integer.parseInt(next());
50 |         }
51 |
52 |         long nextLong()
53 |         {
54 |             return Long.parseLong(next());
55 |         }
56 |
57 |         double nextDouble()
58 |         {
59 |             return Double.parseDouble(next());
60 |         }
61 |
62 |         String nextLine()
63 |         {
64 |             String str = "";
65 |             try {
66 |                 str = br.readLine();
67 |             } catch (IOException e) {
68 |                 e.printStackTrace();
69 |             }
70 |             return str;
71 |         }
72 |     }
73 | }
```

1.5.1 Java Issues

1. Random Shuffle before sorting: `Random rnd = new Random(); rnd.nextInt();`
2. Use StringBuilder for large output
3. Java has strict parsing rules. e.g. using `sc.nextInt()` to read a long will result in RE
4. For class sorting, use code: `implements Comparable<Class name>`. Or, use code: `new Comparator<Interval>() {}` at `Collections.sort()` second argument

2 System Testing

1. Setup bashrc and vimrc
2. Install Java 8, Eclipse 32-bit, g++ compiler
3. Remove Chinese input method
4. Look for compilation parameter and code it into bashrc
5. Test if c++ and java templates work properly on local and judge machine
6. Test "divide by 0" → RE/TLE?
7. Make a complete graph and run Floyd warshall, to test time complexity upper bound

8. Make a linear graph and use DFS to test stack size
9. Print output with extra newline and spaces

3 Reminder

1. 隊友的建議，要認真聽！通常隊友的建議都會突破你盲點
2. Read the problem statements carefully. Input and output specifications and constraints are crucial!
3. Estimate the **time complexity** and **memory complexity** carefully.
4. Time penalty is 20 minutes per WA, **don't rush!**
5. Sample test cases must all be tested and passed before every submission!
6. Test the corner cases, such as 0, 1, -1. Test all edge cases of the input specification.
7. Bus error: the code has *scanf*, *fgets* but have nothing to read! Check if you have early termination but didn't handle it properly.
8. Binary search? 數學算式移項合併後查詢?
9. Two Pointer <-> Binary Search
10. Directed graph connectivity -> DFS. Undirected graph -> Union Find
11. Check connectivity of the graph if the problem statement doesn't say anything (just loop over all nodes!)
12. *longlong* = *int * int* won't work!
13. Shifting for *longlongint* should be something like *1LL << 35*
14. For continuous input problems, be sure to read in all input BEFORE terminating and start processing next the input.
15. Don't use anonymous struct
16. 因式分解
17. 有時候，從答案推回來會容易些!
18. 寫出數學式，有時就馬上出現答案了!

4 Topic list

1. enumeration
2. greedy
3. sorting, topological sort
4. binary search
5. 離散化
6. Dynamic programming, 矩陣快速幂
7. Pigeonhole
8. LCA (倍增法, LCA 轉 RMQ)

5 Useful code

5.1 Leap year

```
1 || year % 400 == 0 || (year % 4 == 0 && year % 100 != 0)
```

5.2 Fast Exponentiation $O(\log(\exp))$

Fermat's little theorem: 若 m 是質數，則 $a^{m-1} \equiv 1 \pmod{m}$

```
1 || ll fast_pow(ll a, ll b, ll M) {
2     ll ans = 1;
3     ll base = a % M;
4     while (b) {
5         if (b & 1)
6             ans = ans * base % M;
7         base = base * base % M;
8         b >>= 1;
9     }
10 }
```

```
10 || return ans;
11 || }
```

5.3 Mod Inverse

Case 1: $\gcd(a, m) = 1$: $ax + my = \gcd(a, m) = 1$ (use `ext_gcd`)

Case 2: m is prime: $a^{m-2} \equiv a^{-1} \pmod{m}$

5.4 GCD $O(\log(a+b))$

注意負數的 case! C++ 是看被除數決定正負號的。

```
1 || ll gcd(ll a, ll b)
2 || {
3 ||     return b == 0 ? a : gcd(b, a % b);
4 || }
```

5.5 Extended Euclidean Algorithm GCD $O(\log(a+b))$

Bezout identity $ax + by = \gcd(a, b)$, where $\gcd(a, b)$ is the smallest positive integer that can be written as $ax + by$, and every integer of the form $ax + by$ is a multiple of $\gcd(a, b)$.

```
1 || ll extgcd(ll a, ll b, ll& x, ll& y) {
2 ||     if (b == 0) {
3 ||         x = 1;
4 ||         y = 0;
5 ||         return a;
6 ||     }
7 ||     else {
8 ||         ll d = extgcd(b, a % b, y, x);
9 ||         y -= (a / b) * x;
10 ||        return d;
11 ||     }
12 || }
```

5.6 Prime Generator

```
1 || const ll MAX_NUM = 1e6; // 要是合數
2 || bool is_prime[MAX_NUM];
3 || vector<ll> primes;
4 ||
5 || void init_primes() {
6 ||     fill(is_prime, is_prime + MAX_NUM, true);
7 ||     is_prime[0] = is_prime[1] = false;
8 ||     for (ll i = 2; i < MAX_NUM; i++) {
9 ||         if (is_prime[i]) {
10 ||             primes.push_back(i);
11 ||             for (ll j = i * i; j < MAX_NUM; j += i)
12 ||                 is_prime[j] = false;
13 ||         }
14 ||     }
15 || }
```

5.7 C++ Reference

```

```

6 Search

6.1 Ternary Search

```

1 double l = ..., r = ....; // input
2 for(int i = 0; i < 100; i++) {
3     double m1 = l + (r - l) / 3, m2 = r - (r - l) / 3;
4     if (f(m1) < f(m2)) // f - convex function
5         l = m1;
6     else
7         r = m2;
8 }
9 f(r) - maximum of function

```

6.2 折半完全列舉

能用 vector 就用 vector

6.3 Two-pointer 爬行法 (右跑左追)

6.4 N Puzzle

```

1 const int dr[4] = {0, 0, +1, -1};
2 const int dc[4] = {+1, -1, 0, 0};
3 const int dir[4] = {'R', 'L', 'D', 'U'};
4 const int INF = 0x3f3f3f3f;
5 const int FOUND = -1;
6 vector<char> path;
7 int A[15][15], Er, Ec;
8
9 int H() {
10     int h = 0;
11     for (int r = 0; r < 4; r++) {
12         for (int c = 0; c < 4; c++) {
13             if (A[r][c] == 0) continue;

9.3 CC

9.3.1 BCC vertex

9.3.2 BCC edge

9.3.3 SCC

First of all we run DFS on the graph and sort the vertices in decreasing of their finishing time (we can use a stack).

Then, we start from the vertex with the greatest finishing time, and for each vertex v that is not yet in any SCC, do : for each u that v is reachable by u and u is not yet in any SCC, put it in the SCC of vertex v . The code is quite simple.

```

1 const int MAX_V = ...;
2 const int INF = 0x3f3f3f3f;
3 int V;
4 vector<int> g[MAX_V];
5
6 int dfn_idx = 0;

```

```

7  int scc_cnt = 0;
8  int dfn[MAX_V];
9  int low[MAX_V];
10 int belong[MAX_V];
11 bool in_st[MAX_V];
12 vector<int> st;
13
14 void scc(int v) {
15     dfn[v] = low[v] = dfn_idx++;
16     st.push_back(v);
17     in_st[v] = true;
18
19     for (int i = 0; i < int(g[v].size()); i++) {
20         const int u = g[v][i];
21         if (dfn[u] == -1) {
22             scc(u);
23             low[v] = min(low[v], low[u]);
24         }
25         else if (in_st[u]) {
26             low[v] = min(low[v], dfn[u]);
27         }
28     }
29
30     if (dfn[v] == low[v]) {
31         int k;
32         do {
33             k = st.back(); st.pop_back();
34             in_st[k] = false;
35             belong[k] = scc_cnt;
36         } while (k != v);
37         scc_cnt++;
38     }
39 }
40
41 void tarjan() { // scc 建立的順序即為反向的拓撲排序
42     st.clear();
43     fill(dfn, dfn + V, -1);
44     fill(low, low + V, INF);
45     dfn_idx = 0;
46     scc_cnt = 0;
47     for (int v = 0; v < V; v++) {
48         if (dfn[v] == -1) {

26     }
27 }

```

```

24 }
25 }

```

9.4.4 Floyd-Warshall $O(V^3)$

The graph is stored using adjacency matrix. The initial state is *diagonal* = 0 and *others* = *INF*. (If *INF* is int, use long long for the matrix)
If diagonal numbers are negative \leftarrow cycle .

```

1 for(int k = 0; k < N; k++)
2     for(int i = 0; i < N; i++)
3         for(int j = 0; j < N; j++)
4             dp[i][j] = min(dp[i][j], dp[i][k] + dp[k][j]);

```

9.5 MST

9.5.1 Kruskal

1. Store the graph by (*weight*, (*from*, *to*))
2. Sort the graph by *weight*
3. Start from the smallest weight, and keep adding edges that won't form a cycle with the current MST set
4. Early termination condition: $n - 1$ edges has been added, NOT size of the union-find set

9.5.2 Prim

```

1 int ans = 0;
2 bool used[n];
3 memset(used, false, sizeof(used));
4
5 priority_queue<ii, vector<ii>, greater<ii>> pq;
6 pq.push(ii(0, 0)); // push (0, origin)
7 while (!pq.empty())
8 {
9     ii cur = pq.top();
10    pq.pop();
11
12    int u = cur.second;
13    if (used[u])
14        continue;
15    ans += cur.first;
16    used[u] = true;
17
18    for (int i = 0; i < (int)g[u].size(); i++) {
19        int v = g[u][i].first, w = g[u][i].second;
20        if (used[v] == false)
21            pq.push(ii(w, v));
22    }
23 }

```

11 String

11.1 Rolling Hash

1. Use two rolling hashes if needed.
2. The prime for pre-calculation can be 137 and 257, for modulo can be $1e9 + 7$ and `0xdefaced`

```

1 #define N 1000100
2 #define B 137
3 #define M 1000000007
4
5 typedef long long ll;
6
7 char inp[N];
8 int len;
9 ll p[N], h[N];
10

```

```

11 void init()
12 { // build polynomial table and hash value
13     p[0] = 1; // b to the ith power
14     for (int i = 1; i <= len; i++) {
15         h[i] = (h[i - 1] * B % M + inp[i - 1]) % M; // hash value
16         p[i] = p[i - 1] * B % M;
17     }
18 }
19
20 ll get_hash(int l, int r) // [l, r] of the inp string array
21 {
22     return ((h[r + 1] - (h[l] * p[r - l + 1])) % M + M) % M;
23 }

```

11.2 KMP

```

1 void fail()
2 {
3     int len = strlen(pat);
4
5     f[0] = 0;
6     int j = 0;
7     for (int i = 1; i < len; i++) {
8         while (j != 0 && pat[i] != pat[j])
9             j = f[j - 1];
10
11         if (pat[i] == pat[j])
12             j++;
13
14         f[i] = j;
15     }
16 }
17
18 int match()
19 {
20     int res = 0;
21     int j = 0, plen = strlen(pat), tlen = strlen(text);

41     return (Item) {
42         m1, r1
43     };
44 }

```

14.8 2-Circle relations

d = 圓心距, R, r 為半徑 ($R \geq r$)

內切: $d = R - r$

外切: $d = R + r$

內離: $d < R - r$

外離: $d > R + r$

相交: $d < R + r$ 且 $d > R - r$

14.9 Fun Facts

1. 如果 $\frac{b}{a}$ 是最簡分數, 則 $1 - \frac{b}{a}$ 也是
- 2.

```

Trig Cheat Sheet

Definition of the Trig Functions

Right triangle definition

For this definition we assume that

$$0 < \theta < \frac{\pi}{2} \text{ or } 0^\circ < \theta < 90^\circ.$$

$$\begin{aligned}\sin \theta &= \frac{\text{opposite}}{\text{hypotenuse}} & \csc \theta &= \frac{\text{hypotenuse}}{\text{opposite}} \\ \cos \theta &= \frac{\text{adjacent}}{\text{hypotenuse}} & \sec \theta &= \frac{\text{hypotenuse}}{\text{adjacent}} \\ \tan \theta &= \frac{\text{opposite}}{\text{adjacent}} & \cot \theta &= \frac{\text{adjacent}}{\text{opposite}}\end{aligned}$$

Unit circle definition

For this definition θ is any angle.

$$\begin{aligned}\sin \theta &= \frac{y}{1} = y & \csc \theta &= \frac{1}{y} \\ \cos \theta &= \frac{x}{1} = x & \sec \theta &= \frac{1}{x} \\ \tan \theta &= \frac{y}{x} & \cot \theta &= \frac{x}{y}\end{aligned}$$

Facts and Properties

Domain

The domain is all the values of θ that can be plugged into the function.

$$\begin{aligned}\sin \theta, \quad \theta &\text{ can be any angle} \\ \cos \theta, \quad \theta &\text{ can be any angle} \\ \tan \theta, \quad \theta &\neq \left(n + \frac{1}{2}\right)\pi, \quad n = 0, \pm 1, \pm 2, \dots \\ \csc \theta, \quad \theta &\neq n\pi, \quad n = 0, \pm 1, \pm 2, \dots \\ \sec \theta, \quad \theta &\neq \left(n + \frac{1}{2}\right)\pi, \quad n = 0, \pm 1, \pm 2, \dots \\ \cot \theta, \quad \theta &\neq n\pi, \quad n = 0, \pm 1, \pm 2, \dots\end{aligned}$$

Range

The range is all possible values to get out of the function.

$$\begin{aligned}-1 \leq \sin \theta \leq 1 & \quad \csc \theta \geq 1 \text{ and } \csc \theta \leq -1 \\ -1 \leq \cos \theta \leq 1 & \quad \sec \theta \geq 1 \text{ and } \sec \theta \leq -1 \\ -\infty < \tan \theta < \infty & \quad -\infty < \cot \theta < \infty\end{aligned}$$

Period

The period of a function is the number, T , such that $f(\theta + T) = f(\theta)$. So, if ω is a fixed number and θ is any angle we have the following periods.

$$\begin{aligned}\sin(\omega\theta) &\rightarrow T = \frac{2\pi}{\omega} \\ \cos(\omega\theta) &\rightarrow T = \frac{2\pi}{\omega} \\ \tan(\omega\theta) &\rightarrow T = \frac{\pi}{\omega} \\ \csc(\omega\theta) &\rightarrow T = \frac{2\pi}{\omega} \\ \sec(\omega\theta) &\rightarrow T = \frac{2\pi}{\omega} \\ \cot(\omega\theta) &\rightarrow T = \frac{\pi}{\omega}\end{aligned}$$

Formulas and Identities

Tangent and Cotangent Identities

$$\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \cot \theta = \frac{\cos \theta}{\sin \theta}$$

Reciprocal Identities

$$\begin{aligned}\csc \theta &= \frac{1}{\sin \theta} & \sin \theta &= \frac{1}{\csc \theta} \\ \sec \theta &= \frac{1}{\cos \theta} & \cos \theta &= \frac{1}{\sec \theta} \\ \cot \theta &= \frac{1}{\tan \theta} & \tan \theta &= \frac{1}{\cot \theta}\end{aligned}$$

Pythagorean Identities

$$\sin^2 \theta + \cos^2 \theta = 1$$

$$\tan^2 \theta + 1 = \sec^2 \theta$$

$$1 + \cot^2 \theta = \csc^2 \theta$$

Even/Odd Formulas

$$\sin(-\theta) = -\sin \theta \quad \csc(-\theta) = -\csc \theta$$

$$\cos(-\theta) = \cos \theta \quad \sec(-\theta) = \sec \theta$$

$$\tan(-\theta) = -\tan \theta \quad \cot(-\theta) = -\cot \theta$$

Periodic Formulas

If n is an integer.

$$\sin(\theta + 2\pi n) = \sin \theta \quad \csc(\theta + 2\pi n) = \csc \theta$$

$$\cos(\theta + 2\pi n) = \cos \theta \quad \sec(\theta + 2\pi n) = \sec \theta$$

$$\tan(\theta + \pi n) = \tan \theta \quad \cot(\theta + \pi n) = \cot \theta$$

Double Angle Formulas

$$\sin(2\theta) = 2\sin \theta \cos \theta$$

$$\cos(2\theta) = \cos^2 \theta - \sin^2 \theta$$

$$= 2\cos^2 \theta - 1$$

$$= 1 - 2\sin^2 \theta$$

$$\tan(2\theta) = \frac{2\tan \theta}{1 - \tan^2 \theta}$$

Degrees to Radians Formulas

If x is an angle in degrees and t is an angle in radians then

$$\frac{\pi}{180} = \frac{t}{x} \quad \Rightarrow \quad t = \frac{\pi x}{180} \quad \text{and} \quad x = \frac{180t}{\pi}$$

Half Angle Formulas (alternate form)

$$\sin \frac{\theta}{2} = \pm \sqrt{\frac{1 - \cos \theta}{2}} \quad \sin^2 \theta = \frac{1}{2}(1 - \cos(2\theta))$$

$$\cos \frac{\theta}{2} = \pm \sqrt{\frac{1 + \cos \theta}{2}} \quad \cos^2 \theta = \frac{1}{2}(1 + \cos(2\theta))$$

$$\tan \frac{\theta}{2} = \pm \sqrt{\frac{1 - \cos \theta}{1 + \cos \theta}} \quad \tan^2 \theta = \frac{1 - \cos(2\theta)}{1 + \cos(2\theta)}$$

Sum and Difference Formulas

$$\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$$

$$\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$$

$$\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$$

Product to Sum Formulas

$$\sin \alpha \sin \beta = \frac{1}{2}[\cos(\alpha - \beta) - \cos(\alpha + \beta)]$$

$$\cos \alpha \cos \beta = \frac{1}{2}[\cos(\alpha - \beta) + \cos(\alpha + \beta)]$$

$$\sin \alpha \cos \beta = \frac{1}{2}[\sin(\alpha + \beta) + \sin(\alpha - \beta)]$$

$$\cos \alpha \sin \beta = \frac{1}{2}[\sin(\alpha + \beta) - \sin(\alpha - \beta)]$$

Sum to Product Formulas

$$\sin \alpha + \sin \beta = 2\sin\left(\frac{\alpha + \beta}{2}\right)\cos\left(\frac{\alpha - \beta}{2}\right)$$

$$\sin \alpha - \sin \beta = 2\cos\left(\frac{\alpha + \beta}{2}\right)\sin\left(\frac{\alpha - \beta}{2}\right)$$

$$\cos \alpha + \cos \beta = 2\cos\left(\frac{\alpha + \beta}{2}\right)\cos\left(\frac{\alpha - \beta}{2}\right)$$

$$\cos \alpha - \cos \beta = -2\sin\left(\frac{\alpha + \beta}{2}\right)\sin\left(\frac{\alpha - \beta}{2}\right)$$

Cofunction Formulas

$$\sin\left(\frac{\pi}{2} - \theta\right) = \cos \theta \quad \cos\left(\frac{\pi}{2} - \theta\right) = \sin \theta$$

$$\csc\left(\frac{\pi}{2} - \theta\right) = \sec \theta \quad \sec\left(\frac{\pi}{2} - \theta\right) = \csc \theta$$

$$\tan\left(\frac{\pi}{2} - \theta\right) = \cot \theta \quad \cot\left(\frac{\pi}{2} - \theta\right) = \tan \theta$$

Unit Circle

For any ordered pair on the unit circle (x, y) : $\cos \theta = x$ and $\sin \theta = y$

Example

$$\cos\left(\frac{5\pi}{3}\right) = \frac{1}{2} \quad \sin\left(\frac{5\pi}{3}\right) = -\frac{\sqrt{3}}{2}$$

Inverse Trig Functions

Definition

$y = \sin^{-1} x$ is equivalent to $x = \sin y$

$y = \cos^{-1} x$ is equivalent to $x = \cos y$

$y = \tan^{-1} x$ is equivalent to $x = \tan y$

Inverse Properties

$$\cos(\cos^{-1}(x)) = x \quad \cos^{-1}(\cos(\theta)) = \theta$$

$$\sin(\sin^{-1}(x)) = x \quad \sin^{-1}(\sin(\theta)) = \theta$$

$$\tan(\tan^{-1}(x)) = x \quad \tan^{-1}(\tan(\theta)) = \theta$$

Domain and Range

Function	Domain	Range
$y = \sin^{-1} x$	$-1 \leq x \leq 1$	$-\frac{\pi}{2} \leq y \leq \frac{\pi}{2}$
$y = \cos^{-1} x$	$-1 \leq x \leq 1$	$0 \leq y \leq \pi$
$y = \tan^{-1} x$	$-\infty < x < \infty$	$-\frac{\pi}{2} < y < \frac{\pi}{2}$

Alternate Notation

$$\sin^{-1} x = \arcsin x$$

$$\cos^{-1} x = \arccos x$$

$$\tan^{-1} x = \arctan x$$

Law of Sines, Cosines and Tangents

Law of Sines

$$\frac{\sin \alpha}{a} = \frac{\sin \beta}{b} = \frac{\sin \gamma}{c}$$

Law of Cosines

$$a^2 = b^2 + c^2 - 2bc \cos \alpha$$

$$b^2 = a^2 + c^2 - 2ac \cos \beta$$

$$c^2 = a^2 + b^2 - 2ab \cos \gamma$$

Mollweide's Formula

$$\frac{a+b}{c} = \frac{\cos \frac{1}{2}(\alpha - \beta)}{\sin \frac{1}{2}\gamma}$$

Law of Tangents

$$\frac{a-b}{a+b} = \frac{\tan \frac{1}{2}(\alpha - \beta)}{\tan \frac{1}{2}(\alpha + \beta)}$$

$$\frac{b-c}{b+c} = \frac{\tan \frac{1}{2}(\beta - \gamma)}{\tan \frac{1}{2}(\beta + \gamma)}$$

$$\frac{a-c}{a+c} = \frac{\tan \frac{1}{2}(\alpha - \gamma)}{\tan \frac{1}{2}(\alpha + \gamma)}$$
