## 1.3 Grep Error and Warnings

```
| g++ main.cpp 2>&1 | grep -E 'warning|error
  1.4 C++ template
    #include <bits/stdc++.h>
   using namespace std;
   typedef long long int ll;
   typedef pair<int, int> ii;
   int main()
        return 0;
10
   }
11
   #include <bits/stdc++.h>
   using namespace std;
    typedef long long int ll;
   typedef pair<int, int> ii;
   int main()
        return 0;
   }
  1.5 Java template
  import java.io.*;
  import java.util.*;
  public class Main
      public static void main(String[] args)
          MyScanner sc = new MyScanner();
          out = new PrintWriter(new BufferedOutputStream(System.out));
          // Start writing your solution here.
          // Stop writing your solution here.
          out.close():
      public static PrintWriter out;
      public static class MyScanner
          BufferedReader br;
          StringTokenizer st;
          public MyScanner()
              br = new BufferedReader(new InputStreamReader(System.in));
          boolean hasNext()
```

```
while (st == null || !st.hasMoreElements()) {
        try {
            st = new StringTokenizer(br.readLine());
        } catch (Exception e) {
            return false;
    return true;
String next()
    if (hasNext())
        return st.nextToken();
   return null;
int nextInt()
    return Integer.parseInt(next());
long nextLong()
    return Long.parseLong(next());
double nextDouble()
    return Double.parseDouble(next());

    String str = "";
        str = br.readLine();
   } catch (IOException e) {
        e.printStackTrace();
    return str;
```

#### 1.5.1 Java Issues

- 1. Random Shuffle before sorting:  $Random\ rnd = new\ Random();\ rnd.nextInt();$
- 2. Use StringBuilder for large output
- 3. Java has strict parsing rules. e.g. using sc.nextInt() to read a long will result in RE
- 4. For class sorting, use code: implements Comparable <br/>Class name>. Or, use code: new Comparator <Interval>()  $\{\}$  at Collections.<br/>sort() second argument

## 2 System Testing

- 1. Setup bashrc and vimrc
- 2. Test Java 8, g++ compiler
- 3. Look for compilation parameter and code it into bashrc
- 4. Test if c++ and java templates work properly on local and judge machine (bits, auto, etc.)
- 5. Test "divide by  $0" \to RE/TLE$ ?
- 6. Make a complete graph and run Floyd warshall, to test time complexity upper bound
- 7. Make a linear graph and use DFS to test stack size
- 8. Test output with extra newline and spaces
- 9. Go to  $Eclipse \rightarrow preference \rightarrow Java \rightarrow Editor \rightarrow ContentAssist$ , add .abcdefghijklmnopqrstuvwxyz to auto activation triggers for Java in Eclipse

## 3 Reminder

- 1. 隊友的建議,要認真聽! 通常隊友的建議都會突破你盲點
- Read the problem statements carefully. Input and output specifications and constraints are crucial!
- 3. Estimate the time complexity and memory complexity carefully.
- 4. Time penalty is 20 minutes per WA, don't rush!
- 5. Sample test cases must all be tested and passed before every submission!
- 6. Test the corner cases, such as 0, 1, -1. Test all edge cases of the input specification.
- 7. Bus error: the code has scanf, fgets but have nothing to read! Check if you have early termination but didn't handle it properly.
- 8. Binary search? 數學算式移項合併後查詢?
- 9. Two Pointer <-> Binary Search
- 10. Directed graph connectivity -> DFS. Undirected graph -> Union Find
- 11. Check connectivity of the graph if the problem statement doesn't say anything (just loop over all nodes!)
- 12. longlong = int \* int won't work!
- 13. Shifting for longlongint should be something like  $1LL \ll 35$
- 14. For continuous input problems, be sure to read in all input BEFORE terminating and start processing next the input.
- 15. Don't use anonymous struct
- 16. 因式分解
- 17. 有時候、從答案推回來會容易些!
- 18. 寫出數學式,有時就馬上出現答案了!
- 19. 記得清理 Global variable

## 4 Topic list

- 1. enumeration
- 2. greedy
- sorting, topological sort
- 4. binary search
- 5. 離散化
- 6. Dynamic programming, 矩陣快速幂
- 7. Pigeonhole
- 8. LCA (倍增法, LCA 轉 RMQ)
- 9. 折半完全列舉 (能用 vector 就用 vector)
- 10. Offline (DFS, LCA)

## 5 Useful code

## 5.1 Leap year O(1)

```
| year % 400 == 0 || (year % 4 == 0 && year % 100 != 0)
```

## **5.2** Fast Exponentiation O(log(exp))

```
Fermat's little theorem: 若 m 是質數, 則 a^{m-1} \equiv 1 \pmod m
```

## 5.3 Mod Inverse O(logn)

```
Case 1: gcd(a, m) = 1: ax + my = gcd(a, m) = 1 (use ext\_gcd)
Case 2: m is prime: a^{m-2} \equiv a^{-1}mod m
```

## **5.4** GCD O(log(min(a+b)))

注意負數的 case! C++ 是看被除數決定正負號的。

```
1 | ll gcd(ll a, ll b)
2 | {
3 | return b == 0 ? a : gcd(b, a % b);
4 | }
```

## 5.5 Extended Euclidean Algorithm GCD O(log(min(a+b)))

Bezout identity ax + by = gcd(a, b), where gcd(a, b) is the smallest positive integer that can be written as ax + by, and every integer of the form ax + by is a multiple of gcd(a, b).

## 5.6 Prime Generator O(nloglogn)

```
const ll MAX_NUM = 1e6; // 要是合數
   bool is prime[MAX NUM];
   vectorprimes:
   void init primes() {
       fill(is_prime, is_prime + MAX_NUM, true);
       is prime[0] = is_prime[1] = false;
       for (ll i = 2; i < MAX NUM; i++) {
           if (is_prime[i]) {
               primes.push_back(i);
10
               for (ll j = i * i; j < MAX_NUM; j += i)
11
                   is_prime[j] = false;
12
13
       }
14
15
```

#### 9.3 CC

#### 9.3.1 BCC

以 Edge 做分界的話, stack 要裝入 (u - v), 並 pop 終止條件為!= (u - v) 以 Articulation point 做為分界 (code below), 注意有無坑人的重邊

```
int cnt, root, dfsTime[N], dfsLow[N], timer, group[N]; // max N nodes
   stack<int> s;
   bool in[N];
3
   void dfs(int u, int p)
        s.push(u);
        in[u] = true;
       dfsTime[u] = dfsLow[u] = timer++;
10
        for (int i = 0; i < (int)g[v].size(); i++) {
11
            int v = q[u][i];
12
13
            if (v == p)
14
                continue;
15
16
```

```
if (dfsTime[v] = 0) {
17
                                                                                     16
                 dfs(v, u);
18
                                                                                     17
                 dfsLow[u] = min(dfsLow[u], dfsLow[v]);
19

  9.3.2 SCC
```

# First of all we run DFS on the graph and sort the vertices in decreasing of their finishing time (we care)

Then, we start from the vertex with the greatest finishing time, and for each vertex v that is not yet in any SCC, do: for each u that v is reachable by u and u is not yet in any SCC, put it in the SCC of vertex v. The code is quite simple.

```
const int MAX_V = ...;
    const int INF = 0x3f3f3f3f;
    int V:
    vector<int> q[MAX V];
    int dfn_idx = 0;
    int scc cnt = 0;
    int dfn[MAX_V];
    int low[MAX_V];
    int belong[MAX_V];
    bool in_st[MAX_V];
11
    vector<int> st;
12
13
    void scc(int v) {
14
        dfn[v] = low[v] = dfn_idx++;
15
```

```
st.push_back(v);
   in st[v] = true:
   for (int i = 0; i < int(g[v].size()); i++) {
       const int u = q[v][i];
       if (dfn[u] == -1) {
           scc(u);
           low[v] = min(low[v], low[u]);

## 9.4.4 Floyd-Warshall $O(V^3)$

The graph is stored using adjacency matrix. The initial state is diagnal=0 and others=INF. (If INF is int, use long long for the matrix) If diagonal numbers are negative  $\leftarrow$  cycle.

 $\sim$ 

```
for(int i = 0; i < N; i++)
       for(int j = 0; j < N; j++)
           dp[i][j] = min(dp[i][j], dp[i][k] + dp[k][j]);
```

#### 9.5 MST

#### 9.5.1 Kruskal

- 1. Store the graph by (weight, (from, to))
- 2. Sort the graph by weight
- 3. Start from the smallest weight, and keep adding edges that won't form a cycle with the current<sup>23</sup>
- 4. Early termination condition: n-1 edges has been added, NOT size of the union-find set

## 9.5.2 Prim int ans = 0:

bool used[n];

```
memset(used, false, sizeof(used));
    priority_queue<ii, vector<ii>, greater<ii>> pq;
    pq.push(ii(0, 0)); // push (0, origin)
    while (!pq.empty())
        ii cur = pq.top();

```

#### 11.4 Trie

注意 count 的擺放位置, 視題意可以擺在迴圈外

```
struct Node {
        int cnt;
        Node* nxt[2];
        Node() {
            cnt = 0;
            fill(nxt, nxt + 2, nullptr);
        }
    };
    const int MAX_Q = 200000;
    int 0;
12
    int NN = 0;
    Node data[MAX 0 * 30];
    Node* root = &data[NN++];
    void insert(Node* u, int x) {
17
        for (int i = 30; i >= 0; i--) {
18
            int t = ((x >> i) & 1);
            if (u->nxt[t] == nullptr) {
20
                 u->nxt[t] = &data[NN++];
21
            }
23
            u = u -> nxt[t];
24
25
            u->cnt++;
        }
26
    }
27
28
    void remove(Node* u, int x) {
        for (int i = 30; i >= 0; i--) {
30
            int t = ((x >> i) & 1):
31
            u = u -> nxt[t];
32
            u->cnt--;
33
        }
34
    }
35
36
    int query(Node* u, int x) {
37
        int res = 0;
38
        for (int i = 30; i >= 0; i--) {
39
            int t = ((x >> i) & 1);
40
            // if it is possible to go the another branch
41
            // then the result of this bit is 1
42
```

```
if (u->nxt[t \land 1] != nullptr && u->nxt[t \land 1]->cnt > 0) {
43
                  u = u - > nxt[t \land 1]:
44
                  res |= (1 << i);
45
46
              else {
47
                  u = u -> nxt[t];
48
49
        }
50
         return res;
51
52
```

## Matrix

#### 12.1 Gauss Jordan

```
typedef long long ll;
    typedef vector<ll> vec;
    typedef vector<vec> mat:
    vec gauss_jordan(mat A) {
        int n = A.size(), m = A[0].size();
        for (int i = 0; i < n; i++) {
            // float: find j s.t. A[j][i] is max
            // mod: find min j s.t. A[j][i] is not 0
            int pivot = i;
10
            for (int j = i; j < n; j++) {
11
12
                // if (fabs(A[j][i]) > fabs(A[pivot])) {
13
                //
                       pivot = i:
                // }
14
                if (A[pivot][i] != 0) {
15
                    pivot = j;
16
                    break;
17
                }
18
            }
19
20
            swap(A[i], A[pivot]);
21
            if (A[i][i] == 0) { // if (fabs(A[i][i]) < eps)</pre>
22
23
                // 無解或無限多組解
                // 可改成 continue, 全部做完後再判
24
                return vec();
25
            }
26
27
            ll divi = inv(A[i][i]);
28
            for (int j = i; j < m; j++) {
29
                // A[i][j] /= A[i][i];
30
                A[i][j] = (A[i][j] * divi) % MOD;
31
32
33
            for (int j = 0; j < n; j++) {
34
                if (j != i) {
35
                    for (int k = i + 1; k < m; k++) {
36
                        // A[j][k] -= A[j][i] * A[i][k];
37
                        ll p = (A[j][i] * A[i][k]) % MOD;
38
                        A[j][k] = (A[j][k] - p + MOD) % MOD;
39
                    }
40
```

```

#### 12.2 Determinant

```
typedef long long ll;
    typedef vector<ll> vec;
    typedef vector<vec> mat;
    ll determinant(mat m) { // square matrix
        const int n = m.size();
        ll det = 1;
        for (int i = 0; i < n; i++) {
            for (int j = i + 1; j < n; j++) {
                int a = i, b = j;
                while (m[b][i]) {
                    ll q = m[a][i] / m[b][i];
12
                     for (int k = 0; k < n; k++)
13
                         m[a][k] = m[a][k] - m[b][k] * q;
14
                     swap(a, b);
15
                }
17
                if (a != i) {
18
                     swap(m[i], m[i]);
19
                     det = -det:
20
            }
22
23
            if (m[i][i] == 0)
24
                 return 0;
            else
                 det *= m[i][i];
27
28
        return det;
29
30
```

## 13 Geometry

- 1. Keep things in integers as much as possible!
- 2. Try not to divide
- 3. If you have decimals, if they are fixed precision, you can usually just multiply all the input and  $_{49}$  use integers instead

## 13.1 EPS

```
= 0: fabs \le eps
< 0: < -eps
> 0: > +eps
```

#### 13.2 Template

## **Trig Cheat Sheet**

## **Definition of the Trig Functions**

#### Right triangle definition

For this definition we assume that

$$0 < \theta < \frac{\pi}{2} \text{ or } 0^{\circ} < \theta < 90^{\circ}.$$

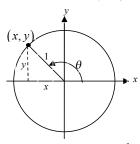

$$\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}}$$
  $\csc \theta = \frac{\text{hypotenuse}}{\text{opposite}}$   $\cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}}$   $\sec \theta = \frac{\text{hypotenuse}}{\text{adjacent}}$ 

$$\tan \theta = \frac{\text{opposite}}{\text{adjacent}}$$
  $\cot \theta = \frac{\text{adjacent}}{\text{opposite}}$ 

#### Unit circle definition

For this definition  $\theta$  is any angle.

$$\sin \theta = \frac{y}{1} = y \qquad \csc \theta = \frac{1}{y}$$

$$\cos \theta = \frac{x}{1} = x \qquad \sec \theta = \frac{1}{x}$$

$$\tan \theta = \frac{y}{x} \qquad \cot \theta = \frac{x}{y}$$

## **Facts and Properties**

#### Domain

The domain is all the values of  $\theta$  that can be plugged into the function.

$$\sin \theta$$
,  $\theta$  can be any angle  $\cos \theta$ ,  $\theta$  can be any angle

$$\tan \theta$$
,  $\theta \neq \left(n + \frac{1}{2}\right)\pi$ ,  $n = 0, \pm 1, \pm 2, \dots$ 

$$\csc \theta$$
,  $\theta \neq n\pi$ ,  $n = 0, \pm 1, \pm 2, ...$ 

$$\sec \theta$$
,  $\theta \neq \left(n + \frac{1}{2}\right)\pi$ ,  $n = 0, \pm 1, \pm 2, \dots$ 

$$\cot \theta$$
,  $\theta \neq n\pi$ ,  $n = 0, \pm 1, \pm 2, \dots$ 

## Range

The range is all possible values to get out of the function.

$$-1 \le \sin \theta \le 1 \qquad \csc \theta \ge 1 \text{ and } \csc \theta \le -1$$

$$-1 \le \cos \theta \le 1 \qquad \sec \theta \ge 1 \text{ and } \sec \theta \le -1$$

$$-\infty < \tan \theta < \infty \qquad -\infty < \cot \theta < \infty$$

#### Period

The period of a function is the number, T, such that  $f(\theta + T) = f(\theta)$ . So, if  $\omega$ is a fixed number and  $\theta$  is any angle we have the following periods.

$$\sin(\omega\theta) \rightarrow T = \frac{2\pi}{\omega}$$

$$\cos(\omega\theta) \rightarrow T = \frac{2\pi}{\omega}$$

$$\tan(\omega\theta) \rightarrow T = \frac{\pi}{\omega}$$

$$\csc(\omega\theta) \rightarrow T = \frac{2\pi}{\omega}$$

$$\sec(\omega\theta) \rightarrow T = \frac{2\pi}{\omega}$$

$$\cot(\omega\theta) \rightarrow T = \frac{\pi}{\omega}$$

#### Formulas and Identities

#### **Tangent and Cotangent Identities**

$$\tan \theta = \frac{\sin \theta}{\cos \theta}$$

$$\cot \theta = \frac{\cos \theta}{\sin \theta}$$

## **Reciprocal Identities**

$$\csc\theta = \frac{1}{\sin\theta}$$

$$\sin\theta = \frac{1}{\csc\theta}$$

$$\sec\theta = \frac{1}{\cos\theta}$$

$$\cos\theta = \frac{1}{\sec\theta}$$

$$\cot \theta = \frac{1}{\tan \theta}$$

$$\tan \theta = \frac{1}{\cot \theta}$$

#### **Pythagorean Identities**

$$\sin^2\theta + \cos^2\theta = 1$$

$$\tan^2 \theta + 1 = \sec^2 \theta$$

$$1 + \cot^2 \theta = \csc^2 \theta$$

#### Even/Odd Formulas

$$\sin(-\theta) = -\sin\theta$$
  $\csc(-\theta) = -\csc\theta$ 

$$\cos(-\theta) = \cos\theta$$
  $\sec(-\theta) = \sec\theta$ 

$$\tan\left(-\theta\right) = -\tan\theta$$

$$\cot(-\theta) = -\cot\theta$$

#### Periodic Formulas

If *n* is an integer.

$$\sin(\theta + 2\pi n) = \sin\theta \quad \csc(\theta + 2\pi n) = \csc\theta$$

$$\cos(\theta + 2\pi n) = \cos\theta \quad \sec(\theta + 2\pi n) = \sec\theta$$

$$\tan(\theta + \pi n) = \tan\theta \quad \cot(\theta + \pi n) = \cot\theta$$

## **Double Angle Formulas**

$$\sin(2\theta) = 2\sin\theta\cos\theta$$

$$\cos(2\theta) = \cos^2 \theta - \sin^2 \theta$$
$$= 2\cos^2 \theta - 1$$
$$= 1 - 2\sin^2 \theta$$

$$\tan(2\theta) = \frac{2\tan\theta}{1-\tan^2\theta}$$

## **Degrees to Radians Formulas**

If x is an angle in degrees and t is an angle in radians then

$$\frac{\pi}{180} = \frac{t}{x} \implies t = \frac{\pi x}{180} \quad \text{and} \quad x = \frac{180t}{\pi} \qquad \frac{\csc\left(\frac{\pi}{2} - \theta\right) = \sec\theta}{\tan\left(\frac{\pi}{2} - \theta\right) = \cot\theta} \qquad \frac{\sec\left(\frac{\pi}{2} - \theta\right) = \csc\theta}{\cot\left(\frac{\pi}{2} - \theta\right) = \tan\theta}$$

#### **Half Angle Formulas** (alternate form)

$$\sin\frac{\theta}{2} = \pm\sqrt{\frac{1-\cos\theta}{2}} \qquad \sin^2\theta = \frac{1}{2}(1-\cos(2\theta))$$

$$\cos\frac{\theta}{2} = \pm\sqrt{\frac{1+\cos\theta}{2}}$$
  $\cos^2\theta = \frac{1}{2}(1+\cos(2\theta))$ 

$$\tan\frac{\theta}{2} = \pm\sqrt{\frac{1-\cos\theta}{1+\cos\theta}} \qquad \tan^2\theta = \frac{1-\cos(2\theta)}{1+\cos(2\theta)}$$

#### **Sum and Difference Formulas**

$$\sin(\alpha \pm \beta) = \sin\alpha \cos\beta \pm \cos\alpha \sin\beta$$

$$\cos(\alpha \pm \beta) = \cos\alpha \cos\beta \mp \sin\alpha \sin\beta$$

$$\tan(\alpha \pm \beta) = \frac{\tan\alpha \pm \tan\beta}{1 \mp \tan\alpha \tan\beta}$$

#### **Product to Sum Formulas**

$$\sin \alpha \sin \beta = \frac{1}{2} \Big[ \cos (\alpha - \beta) - \cos (\alpha + \beta) \Big]$$

$$\cos \alpha \cos \beta = \frac{1}{2} \left[ \cos (\alpha - \beta) + \cos (\alpha + \beta) \right]$$

$$\sin \alpha \cos \beta = \frac{1}{2} \left[ \sin(\alpha + \beta) + \sin(\alpha - \beta) \right]$$

$$\cos \alpha \sin \beta = \frac{1}{2} \left[ \sin(\alpha + \beta) - \sin(\alpha - \beta) \right]$$

#### **Sum to Product Formulas**

$$\sin \alpha + \sin \beta = 2 \sin \left(\frac{\alpha + \beta}{2}\right) \cos \left(\frac{\alpha - \beta}{2}\right)$$

$$\sin \alpha - \sin \beta = 2\cos \left(\frac{\alpha + \beta}{2}\right) \sin \left(\frac{\alpha - \beta}{2}\right)$$

$$\cos \alpha + \cos \beta = 2 \cos \left( \frac{\alpha + \beta}{2} \right) \cos \left( \frac{\alpha - \beta}{2} \right)$$

$$\cos \alpha - \cos \beta = -2 \sin \left( \frac{\alpha + \beta}{2} \right) \sin \left( \frac{\alpha - \beta}{2} \right)$$

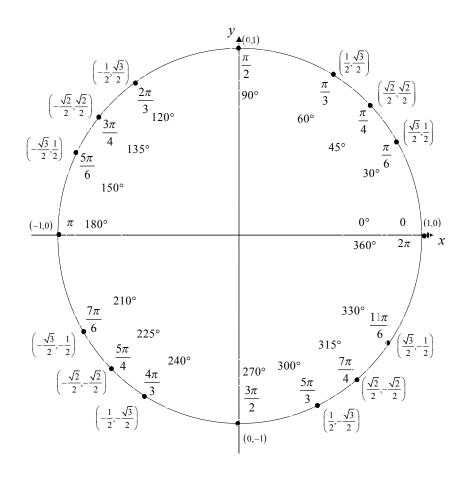

#### **Cofunction Formulas**

$$\sin\left(\frac{\pi}{2} - \theta\right) = \cos\theta$$
  $\cos\left(\frac{\pi}{2} - \theta\right) = \sin\theta$ 

$$\csc\left(\frac{\pi}{2} - \theta\right) = \sec \theta$$
  $\sec\left(\frac{\pi}{2} - \theta\right) = \csc \theta$ 

$$\tan\left(\frac{\pi}{2} - \theta\right) = \cot\theta \qquad \cot\left(\frac{\pi}{2} - \theta\right) = \tan\theta$$

## **Unit Circle**

For any ordered pair on the unit circle (x, y):  $\cos \theta = x$  and  $\sin \theta = y$ 

#### Example

$$\cos\left(\frac{5\pi}{3}\right) = \frac{1}{2} \qquad \sin\left(\frac{5\pi}{3}\right) = -\frac{\sqrt{3}}{2}$$

#### **Inverse Trig Functions**

#### **Definition**

 $y = \sin^{-1} x$  is equivalent to  $x = \sin y$  $y = \cos^{-1} x$  is equivalent to  $x = \cos y$ 

 $y = \tan^{-1} x$  is equivalent to  $x = \tan y$ 

**Inverse Properties** 

 $\cos(\cos^{-1}(x)) = x \qquad \cos^{-1}(\cos(\theta)) = \theta$ 

 $\sin(\sin^{-1}(x)) = x \qquad \sin^{-1}(\sin(\theta)) = \theta$ 

 $\tan(\tan^{-1}(x)) = x \qquad \tan^{-1}(\tan(\theta)) = \theta$ 

#### **Domain and Range**

Function	Domain	Range
$y = \sin^{-1} x$	$-1 \le x \le 1$	$-\frac{\pi}{2} \le y \le \frac{\pi}{2}$
$y = \cos^{-1} x$	$-1 \le x \le 1$	$0 \le y \le \pi$

$$y = \tan^{-1} x$$
  $-\infty < x < \infty$   $-\frac{\pi}{2} < y < \frac{\pi}{2}$ 

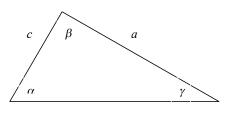

#### **Alternate Notation**

$$\sin^{-1} x = \arcsin x$$

$$\cos^{-1} x = \arccos x$$

$$\tan^{-1} x = \arctan x$$

## Law of Sines, Cosines and Tangents

h

#### Law of Sines

$$\frac{\sin \alpha}{a} = \frac{\sin \beta}{b} = \frac{\sin \gamma}{c}$$

#### Law of Cosines

$$a^{2} = b^{2} + c^{2} - 2bc \cos \alpha$$
$$b^{2} = a^{2} + c^{2} - 2ac \cos \beta$$
$$c^{2} = a^{2} + b^{2} - 2ab \cos \gamma$$

## Law of Tangents

$$\frac{a-b}{a+b} = \frac{\tan\frac{1}{2}(\alpha-\beta)}{\tan\frac{1}{2}(\alpha+\beta)}$$

$$\frac{b-c}{b+c} = \frac{\tan\frac{1}{2}(\beta-\gamma)}{\tan\frac{1}{2}(\beta+\gamma)}$$

$$\frac{a-c}{a+c} = \frac{\tan \frac{1}{2} (\alpha - \gamma)}{\tan \frac{1}{2} (\alpha + \gamma)}$$

#### Mollweide's Formula

$$\frac{a+b}{c} = \frac{\cos\frac{1}{2}(\alpha-\beta)}{\sin\frac{1}{2}\gamma}$$
