                    e.printStackTrace();
69
                return str;
```

1.4.1 Java Issues

- 1. Random Shuffle before sorting: Random rnd = new Random(); rnd.nextInt();
- 2. Use StringBuilder for large output

2 Reminder

- 1. 隊友的建議,要認真聽! 通常隊友的建議都會突破你盲點
- 2. Read the problem statements carefully. Input and output specifications and constraints are crucial!
- 3. Estimate the **time complexity** and **memory complexity** carefully.
- 4. Time penalty is 20 minutes per WA, don't rush!
- 5. Sample test cases must all be tested and passed before every submission!
- 6. Test the corner cases, such as 0, 1, -1. Test all edge cases of the input specification.
- 7. Bus error: the code has scanf, fgets but have nothing to read! Check if you have early termination but didn't handle it properly.
- 8. Binary search? 數學算式移項合併後查詢?
- 9. Two Pointer <-> Binary Search

3 Useful code

3.1 Leap year

```
| year % 400 == 0 || (year % 4 == 0 && year % 100 != 0)
```

3.2 Fast Exponentiation O(log(exp))

```
11 res = 1;
while (exp > 0) {
    if (exp & 1) {
        res = ((res % mod) * (base % mod)) % mod;
    }
    exp >>= 1;
    base = (base * base) % mod;
}
return res;
}
```

3.3 GCD O(log(a+b))

注意負數的 case!

3.4 Extended Euclidean Algorithm

Bezout identity ax + by = gcd(a, b), where gcd(a, b) is the smallest positive integer that can be written as ax + by, and every integer of the form ax + by is a multiple of gcd(a, b).

3.5 Mod Inverse

Case 1 gcd(a, m) = 1: ax + my = gcd(a, m) = 1 (use ext_gcd) Case 2 m is prime: $a^{m-2} \equiv a^{-1}mod$ m (use Fermat's little theorem)

3.6 Prime Generator

```
bool is_prime[N];
vector<ll> primes;

void init()
{
    fill(is_prime, is_prime + N, true);
    for (int i = 2; i < N; i++) {</pre>
```

3.7 Binomial Coefficient

3.8 STL quick reference

3.8.1 Map

```
map<T1, T2> m; // iterable
void clear();
void erase(T1 key);
it find(T1 key); // <key, val>
void insert(pair<T1, T2> P);
T2 &[](T1 key); // if key not in map, new key will be inserted with default val
it lower_bound(T1 key); // = m.end() if not found, *it = <key, val>
it upper_bound(T1 key); // = m.end() if not found, *it = <key, val>
```

3.8.2 Set

```
set<T> s; // iterable
void clear();
size_t count(T val); // number of val in set
void erase(T val);
it find(T val); // = s.end() if not found
void insert(T val);
it lower_bound(T val); // = s.end() if not found, *it = <key, val>
it upper_bound(T val); // = s.end() if not found, *it = <key, val>
```

3.8.3 Algorithm

```
// return if i is smaller than j
  comp = [&](const T &i, const T &j) -> bool;
  vector<T> v;
  bool any of(v.begin(), v.end(), [&](const T &i) -> bool);
  bool all of(v.begin(), v.end(), [&](const T &i) -> bool);
  void copy(inp.begin(), in.end(), out.begin());
  int count(v.begin(), v.end(), int val); // number of val in v
  it unique(v.begin(), v.end());
                                         // it - v.begin() = size
  // after calling, v[nth] will be n-th smallest elem in v
  void nth element(v.begin(), nth it, bin comp);
  void merge(in1.begin(), in1.end(), in2.begin(), in2.end(), out.begin(),
  // include union, intersection, difference, symmetric difference(xor)
  void set union(in1.begin(), in1.end(), in2.begin(), in2.end(), out.
      begin(), comp);
  bool next permutation(v.begin(), v.end());
15 // v1, v2 need sorted already, whether v1 includes v2
bool inclues(v1.begin(), v1.end(), v2.begin(), v2.end());
it find(v.begin(), v.end(), T val); // = v.end() if not found
it search(v1.begin(), v1.end(), v2.begin(), v2.end());
it lower bound(v.begin(), v.end(), T val);
it upper bound(v.begin(), v.end(), T val);
bool binary search(v.begin(), v.end(), T val); // exist in v ?
void sort(v.begin(), v.end(), comp);
void stable_sort(v.begin(), v.end(), comp);
```

3.8.4 String

3.8.5 Priority Queue

```
bool cmp(ii a, ii b)
